

LMS Dawateislami

1. Professional Summary

This document presents QA work performed on a Learning Management System (LMS) used for e-learning activities. The testing focused on real user flows, defect detection, and validation of system behavior across core modules to ensure stable and reliable usage. The objective was to verify functionality from an end-user perspective and ensure smooth content delivery, assessment handling, and navigation.

2. Project Scope

Testing covered end-to-end LMS functionality including user registration and login, course enrollment and access control, video lecture playback, quiz and assessment system, assignment submission flow, user dashboard, and admin panel. Each module was validated for functional correctness, workflow consistency, and user interaction quality

3. QA Activities Performed

All major modules were tested using functional, positive, and negative test scenarios. Regression testing was performed after every fix to ensure stability. Defects were documented with clear reproduction steps and categorized based on severity and priority. UI validation and basic cross-browser testing were also conducted to maintain consistency across environments.

4. Testing Approach

A structured manual testing approach was followed, starting with requirement analysis and test scenario preparation. Test cases were executed across multiple builds to ensure reliability. Defects were logged with precise steps and expected vs actual results. After fixes, retesting and regression cycles were performed to confirm system stability.

5. Bug & Test Summary

Total no of Test Case		126	Total task		26
Verified		14	Unverified		12
	Blocker	5		high	5
	Major	8		Medium	14
	Medium /Minor	2		Low	2

Key issues were mainly found in authentication and content delivery flows, directly impacting user experience.

6. Tools Used

Test cases and bug tracking were managed in Jira, Excel, TMS, while Browser Developer Tools were used for UI and console checks. Postman was used for API validation where required to ensure correct system behavior.

7. Key Observations

Login and authentication issues impacted core system access and user navigation. Video playback instability disrupted the learning experience and content flow. Quiz scoring inconsistencies required backend validation for accurate results. A few UI alignment issues were also identified, affecting overall visual consistency.

8. Challenges & Resolution

Video playback was inconsistent, affecting learning flow and progress tracking. The issue was documented with clear steps and escalated to the backend team. Similarly, incorrect quiz scores were shown after submission due to a mismatch between expected and actual results, and the defect was reported for correction of the calculation logic.

9.What improved here:

- Removed repeated wording (“smooth user experience”, “proper functionality” repeated too much), Made sentences sharper and more QA-focused,
- Reduced filler phrases, Improved flow so it reads like real experience, not template text, Strengthened impact in issues section
